#### (54) Title: ALKALINE LIPOLYTIC ENZYME

#### (57) Abstract

An alkaline lipolytic enzyme can be derived from fungal strains of Botryosphaeria or Guignardia, two closely related genera not previously reported to produce lipolytic enzyme. The novel lipolytic enzyme has optimum activity around pH 10, making it well suited for use in detergents. Advantageously, the microorganisms are Ascomycetes for which suitable expression systems are well developed.

#### ALKALINE LIPOLYTIC ENZYME

#### TECHNICAL FIELD

This invention relates to an alkaline lipolytic enzyme, to a lipolytic enzyme-producing microbial strain, to methods for the production of lipolytic enzyme and to a detergent composition comprising the lipolytic enzyme.

#### **BACKGROUND ART**

For a number of years lipolytic enzymes have been used as detergent additives to remove lipid or fatty stains from clothes and other textiles.

Thus, the prior art suggests the use of various microbial lipases as 10 detergent additives. Examples include lipases derived from *Humicola lanuginosa* (also called *Thermomyces lanuginosus*, EP 258 068 and EP 305 216), *Rhizomucor miehei* (EP 238 023), *Candida antarctica* (EP 214 761), various species of *Pseudomonas* such as *P. alcaligenes* and *P. pseudoalcaligenes* (EP 218 272), *P. cepacia* (EP 331 376), *Bacillus*, e.g. *B. subtilis* (Dartois et al., (1993) Biochemica et 15 Biophysica Acta 1131, 253-260), *B. stearothermophilus* (JP-A 64-74992) and *B. pumilus* (WO 91/16422).

For commercial production of enzymes such as lipases, it is preferred to express the enzyme in a suitable host organism for higher yield. Various expression systems are available, including expression of enzymes from 20 Ascomycetes in Aspergillus (EP 238 023).

Many detergents are alkaline with a high pH in solution (e.g. around pH 10), so there is a need for lipolytic enzymes with high activity at high pH. The lipolytic enzyme should be derived from a type of microorganism for which suitable expression systems are available.

#### 25 SUMMARY OF THE INVENTION

Surprisingly, we have found that an alkaline lipolytic enzyme can be derived from fungal strains of *Botryosphaeria or Guignardia*, two closely related genera not previously reported to produce lipolytic enzyme. The novel lipolytic enzyme has optimum activity around pH 10, making it well suited for use in

detergents. Advantageously, the microorganisms are *Ascomycetes* for which suitable expression systems are well developed.

Accordingly, the invention provides a lipolytic enzyme which is derived from a strain of *Botryosphaeria or Guignardia* or is immunologically reactive with an antibody raised against a purified lipolytic enzyme produced by such strain, and has optimum activity at a pH in the range 9-11 in the presence of 50 mM Ca\*\*.

Another aspect of the invention provides an alkaline lipolytic enzyme which contains an amino acid sequence selected from the group consisting of SEQ ID NO: 1, 2, 3, 4 and 5.

The invention also provides novel lipolytic enzyme-producing strains of *Botryosphaeria* as a biologically pure culture.

In another aspect, the invention provides a process for producing an alkaline lipolytic enzyme, comprising cultivation of a lipolytic enzyme-producing strain of *Botryosphaeria* or *Guignardia* in a suitable nutrient medium, followed by recovery 15 of the alkaline lipolytic enzyme.

The invention further provides a method for producing an alkaline lipolytic enzyme, comprising:

- a) isolating a DNA fragment encoding the lipolytic enzyme from a lipolytic enzyme-producing strain of *Botryosphaeria or Guignardia*,
- b) combining the DNA fragment with appropriate expression signal(s) in an appropriate vector,
  - c) introducing the vector or parts thereof into an appropriate host,
  - d) cultivating the host organism under conditions leading to expression of the lipolytic enzyme, and
    - e) recovering the lipolytic enzyme from the culture medium.

Finally, the invention provides a detergent composition comprising a surfactant together with an effective amount of said lipolytic enzyme.

#### BRIEF DESCRIPTION OF THE DRAWINGS

25

Figures 1 and 2 show graphs of lipolytic enzyme activity vs. pH for 30 lipolytic enzymes produced by *Botryosphaeria sp.* CBS 102.95 and *B. ribis* CBS 504.94, respectively.

#### DETAILED DISCLOSURE OF THE INVENTION

#### Microorganisms

The microbial strains used in this invention belong to the genera Botryosphaeria or Guignardia. The two genera are closely related and were s considered synonyms by M.E. Barr (Contrib. Univ. Mich. Herb., 9: 523-638, 1972), but most authors consider them separate genera - see for instance A. Sivanesan, J. Cramer, Vaduz, 701 pp, 1984.

Both genera are described by Richard T. Hanlin, Illustrated Genera of Ascomycetes, APS Press, The American Phytopathological Society, St. Paul, 10 Minnesota, 1990, p. 46-49. The genus *Botryosphaeria* is also described by Punithalingam, E. & Holliday, P. (1973) *CMI Descriptions of Pathogenic Fungi and Bacteria* No. 395. When cultivated, the strains may develop in the *Fusicoccum* state or the microconidial state.

Two strains have been isolated and deposited by the inventors according to the Budapest Treaty on the International Recognition of the Deposit of Microorganisms for the Purposes of Patent Procedure at Centraalbureau Voor Schimmelcultures (CBS), Oosterstraat 1, Postbus 273, NL-3740 AG Baarn, Netherlands. The two strains were classified by standard taxonomic methods.

The deposit data and the taxonomic identification of the strains were 20 as follows:

Depositors' reference	NN143554	NN115210
Deposit number	CBS 102.95	CBS 504.94
Deposit date	January 6, 1995	October 19, 1994
Taxonomic designation	Botryosphaeria sp.	Botryosphaeria ribis

Also, the following publicly available strains can be used in the invention:

r	T -		
Genus	Species	Inventors' strain No.	Deposit number
	B. berengeriana	NN102565	MAFF 06-45001
	B. berengeriana f. sp. pilicola	NN102566	MAFF 06-45002

The above-mentioned strains are freely available from the following 5 depositary institutions for microorganisms:

MAFF: Ministry of Agriculture, Forestry and Fisheries, National Institute of Agro-Biological Research, 1-2 Kannon-dai 2-chome, Tsukuba, Ibaraki 305, Japan. JCM: Japan Collection of Microorganisms, RIKEN, Wako, Saitama 351-01, Japan.

IFO: Institute for Fermentation, Osaka, 17-85, Juso-honmachi 2-chome, Yodogawa-ku, Osaka 532, Japan.

CBS: Centraal Bureau voor Schimmelcultures, Oosterstraat 1, 3740 AG Baarn, Netherlands.

5 ATCC: American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852, USA.

Variants and mutants of these strains, capable of producing lipolytic enzyme, may also be used in the invention.

#### Production of lipolytic enzyme

Lipolytic enzyme may be produced by cultivating any of the microorganisms described above in a suitable nutrient medium, optionally followed by recovery and purification, according to methods well known in the art or as described in the examples of this specification.

The lipolytic enzyme may also be obtained by recombinant DNA15 technology by methods known in the art *per se*, e.g. isolating a DNA fragment
encoding the lipolytic enzyme, combining the DNA fragment with appropriate
expression signal(s) in an appropriate vector, introducing the vector or parts thereof
into an appropriate host (e.g. a filamentous fungus, preferably a member of the
genus *Aspergillus*), either as an autonomously replicating plasmid or integrated into
20 the chromosome, cultivating the host organism under conditions leading to
expression of the lipolytic enzyme, and recovering the lipolytic enzyme from the
culture medium.

The isolation of a DNA sequence may be done by so-called expression cloning, comprising the following steps:

- a) cloning, in suitable vectors, a cDNA library from a lipolytic enzymeproducing strain of *Botryosphaeria or Guignardia*,
  - b) transforming suitable yeast host cells with said vectors,
  - c) cultivating the transformed yeast host cells under suitable conditions to express the alkaline lipolytic enzyme,
- d) screening for positive clones by determining the lipolytic enzyme activity expressed in step (c).

The expression cloning may be done as described in WO 93/11249 or in H. Dalbøge and H.P. Heldt-Hansen, *Mol. Gen. Genet.* (1994) 243:253-260. A preferred heterologous host cell is a strain of *Aspergillus*, e.g. *A. oryzae* or *A. niger*, e.g. using the expression system described in EP-A-0 238 023.

After the cultivation, the lipolytic enzyme may be recovered and purified from the culture broth by conventional methods, such as hydrophobic chromatography, ion exchange chromatography and combinations thereof.

#### Lipolytic enzymes

The enzymes of this invention are lipolytic enzymes. In the present context the term "lipolytic enzyme" is intended to indicate an enzyme classified under the Enzyme Classification number E.C. 3.1.1.- (Carboxylic Ester Hydrolases) in accordance with the Recommendations (1992) of the International Union of Biochemistry and Molecular Biology (IUBMB). Lipolytic enzymes thus exhibit hydrolytic activity towards at least one of the types of ester bonds mentioned in the context of E.C. 3.1.1. The lipolytic enzymes of the invention preferably have lipase activity (with triglycerides as substrate).

#### **Enzymatic** properties

The lipolytic enzymes of this invention are characterized by high activity at alkaline pH. More specifically, they have optimum activity at a pH higher than 9, 20 particularly in the range 9-11, in the presence of 50 mM Ca<sup>++</sup>.

Figures 1 and 2 show graphs of lipolytic enzyme activity vs. pH for lipolytic enzymes produced by *Botryosphaeria sp.* CBS 102.95 and *B. ribis* CBS 504.94, respectively. Both lipolytic enzymes have optimum activity at about pH 10.

The isoelectric point is 3.8 for lipolytic enzyme from CBS 102.95 and 3.4 for lipolytic enzyme from CBS 504.94. The molecular weight is 55,000 Dalton for lipolytic enzyme from CBS 102.95 and 64,000 for lipolytic enzyme from CBS 504.94. The specific lipolytic enzyme activity is 400 LU/A<sub>280</sub> for lipolytic enzyme from CBS 102.95 and 300 LU/A<sub>280</sub> for lipolytic enzyme from CBS 504.94 (A<sub>280</sub> = mg of protein determined from absorbance at 280 nm).

5

One Lipolytic enzyme Unit (LU) is the amount of enzyme which, under standard conditions (i.e. at 30.0°C; pH 7.0; and tributyrin substrate) liberates 1  $\mu$ mol of titratable butyric acid per minute.

#### Immunochemical Properties

Alkaline lipolytic enzymes having immunochemical properties identical or partially identical to those of a lipolytic enzyme native to a strain of *Botryosphaeria* or *Guignardia* and having the stated properties are within the scope of the invention.

The immunochemical properties can be determined by immunological cross-reaction identity tests. The identity tests can be performed by the well-known 10 Ouchterlony double immunodiffusion procedure or by tandem crossed immunoelectrophoresis according to 1. M. Roitt; Immunology, Gower Medical Publishing (1985) and N. H. Axelsen; Handbook of Immunoprecipitation-in-Gel Techniques, Blackwell Scientific Publications (1983), Chapters 5 and 14. The terms immunochemical identity (antigenic identity) and partial immunochemical identity (partial antigenic identity) are described in Axelsen, *supra*, Chapters 5, 19 and 20 and Roitt, *supra*, Chapter 6.

Monospecific antiserum for use in immunological tests can be raised, e.g. in rabbits, against a purified lipolytic enzyme, e.g. as described in Chapter 41 of N.H. Axelsen, *supra* or Chapter 23 of N.H. Axelsen et al., A Manual of Quantitative Immunoelectrophoresis, Blackwell Scientific Publications (1973).

#### Detergent additive

According to the invention, the lipolytic enzyme may typically be used as an additive in a detergent composition. This additive is conveniently formulated as a non-dusting granulate, a stabilized liquid, a slurry or a protected enzyme.

A suitable activity range for a detergent additive containing the lipolytic enzyme of this invention is 0.01-100 mg of pure enzyme protein per g of the detergent additive

#### Detergent

The lipolytic enzyme of the invention may be incorporated in concentrations conventionally employed in detergents. The amount of lipolytic enzyme protein may be 0.001-10 mg per gram of detergent or 0.001-100 mg per liter 5 of wash liquor.

#### **Detergent Compositions**

According to the invention, the lipolytic enzyme may typically be a component of a detergent composition. As such, it may be included in the detergent composition in the form of a non-dusting granulate, a stabilized liquid, or a protected 10 enzyme. Non-dusting granulates may be produced, e.g., as disclosed in US 4,106,991 and 4,661,452 (both to Novo Industri A/S) and may optionally be coated by methods known in the art. Examples of waxy coating materials are poly(ethylene oxide) products (polyethylene glycol, PEG) with mean molecular weights of 1000 to 20000; ethoxylated nonylphenols having from 16 to 50 ethylene oxide units; 15 ethoxylated fatty alcohols in which the alcohol contains from 12 to 20 carbon atoms and in which there are 15 to 80 ethylene oxide units; fatty alcohols; fatty acids; and mono- and di- and triglycerides of fatty acids. Examples of film-forming coating materials suitable for application by fluid bed techniques are given in patent GB 1483591. Liquid enzyme preparations may, for instance, be stabilized by adding a 20 polyol such as propylene glycol, a sugar or sugar alcohol, lactic acid or boric acid according to established methods. Other enzyme stabilizers are well known in the art. Protected enzymes may be prepared according to the method disclosed in EP 238,216.

The detergent composition of the invention may be in any convenient 25 form, e.g. as powder, granules, paste or liquid. A liquid detergent may be aqueous, typically containing up to 70% water and 0-30% organic solvent, or nonaqueous.

The detergent composition comprises one or more surfactants, each of which may be anionic, nonionic, cationic, or zwitterionic. The detergent will usually contain 0-50% of anionic surfactant such as linear alkylbenzene sulfonate (LAS), alpha-olefin sulfonate (AOS), alkyl sulfate (fatty alcohol sulfate) (AS), alcohol ethoxysulfate (AEOS or AES), secondary alkane sulfonates (SAS), alpha-sulfo fatty

acid methyl esters, alkyl- or alkenylsuccinic acid, or soap. It may also contain 0-40% of nonionic surfactant such as alcohol ethoxylate (AEO or AE), carboxylated alcohol ethoxylates, nonylphenol ethoxylate, alkylpolyglycoside, alkyldimethylamine oxide, ethoxylated fatty acid monoethanolamide, fatty acid monoethanolamide, or polyhydroxy alkyl fatty acid amide (e.g. as described in WO 92/06154).

The detergent composition may additionally comprise one or more other enzymes, such as amylase, cutinase, protease, cellulase, peroxidase, and oxidase, e.g., laccase.

The detergent may contain 1-65% of a detergent builder or complexing agent such as zeolite, diphosphate, triphosphate, phosphonate, citrate, nitrilotriacetic acid (NTA), ethylenediaminetetraacetic acid (EDTA), diethylenetriaminepentaacetic acid (DTMPA), alkyl- or alkenylsuccinic acid, soluble silicates or layered silicates (e.g. SKS-6 from Hoechst). The detergent may also be unbuilt, i.e. essentially free of detergent builder.

The detergent may comprise one or more polymers. Examples are carboxymethyl cellulose (CMC), poly(vinyl pyrrolidone) (PVP), polyethylene glycol (PEG), poly(vinyl alcohol) (PVA), polycarboxylates such as polyacrylates, maleic/acrylic acid copolymers and lauryl methacrylate/acrylic acid copolymers.

The detergent may contain a bleaching system which may comprise 20 a H<sub>2</sub>O<sub>2</sub> source such as perborate or percarbonate which may be combined with a peracid-forming bleach activator such as tetraacetylethylenediamine (TAED) or nonanoyloxybenzene sulfonate (NOBS). Alternatively, the bleaching system may comprise peroxy acids of, e.g., the amide, imide, or sulfone type.

The enzymes of the detergent composition of the invention may be stabilized using conventional stabilizing agents, e.g. a polyol such as propylene glycol or glycerol, a sugar or sugar alcohol, lactic acid, boric acid, or a boric acid derivative such as, e.g., an aromatic borate ester, and the composition may be formulated as described in, e.g., WO 92/19709 and WO 92/19708.

The detergent may also contain other conventional detergent 30 ingredients such as, e.g., fabric conditioners including clays, foam boosters, suds suppressors, anti-corrosion agents, soil-suspending agents, anti-soil-redeposition agents, dyes, bactericides, optical brighteners, or perfume.

The pH (measured in aqueous solution at use concentration) will usually be neutral or alkaline, e.g. in the range of 7-11.

Particular forms of detergent compositions within the scope of the invention include:

## 5 1) A detergent composition formulated as a granulate having a bulk density of at least 600 g/l comprising

	Linear alkylbenzene sulfonate (calculated as acid)	7 - 12%
	Alcohol ethoxysulfate (e.g. $C_{12-16}$ alcohol, 1-2 EO) or alkyl sulfate (e.g. $C_{16-18}$ )	1 - 4%
10	Alcohol ethoxylate (e.g. C <sub>14-15</sub> alcohol, 7 EO)	5 - 9%
·	Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	14 - 20%
	Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )	2 - 6%
	Zeolite (as NaAlSiO <sub>4</sub> )	15 - 22%
	Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )	0 - 6%
15	Sodium citrate/citric acid (as C <sub>6</sub> H <sub>5</sub> Na <sub>5</sub> O <sub>7</sub> /C <sub>6</sub> H <sub>8</sub> O <sub>7</sub> )	0 - 15%
	Sodium perborate (as NaBO <sub>3</sub> .H <sub>2</sub> O)	11 - 18%
,	TAED	2 - 6%
	Carboxymethyl cellulose	0 - 2%
	Polymers (e.g. maleic/acrylic acid copolymer, PVP, PEG)	0 - 3%
20	Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
	Minor ingredients (e.g. suds suppressors, perfume, optical brightener, photobleach)	0 - 5%

## 2) A detergent composition formulated as a granulate having a bulk density of at least 600 g/l comprising

25	Linear alkylbenzene sulfonate (calculated as acid)	6 - 11%
	Alcohol ethoxysulfate (e.g. $C_{12-18}$ alcohol, 1-2 EO or alkyl sulfate (e.g. $C_{18-18}$ )	1 - 3%
	Alcohol ethoxylate (e.g. C <sub>14-15</sub> alcohol, 7 EO)	5 - 9%
	Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	15 - 21%

Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )	1 - 4%
Zeolite (as NaAlSiO <sub>4</sub> )	24 - 34%
Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )	4 - 10%
Sodium citrate/citric acid (as C <sub>6</sub> H <sub>2</sub> Na <sub>3</sub> O <sub>7</sub> /C <sub>6</sub> H <sub>6</sub> O <sub>7</sub> )	0 - 15%
Carboxymethyl cellulose	0 - 2%
Polymers (e.g. maleic/acrylic acid copolymer, PVP, PEG)	1 - 6%
Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
Minor ingredients (e.g. suds suppressors, perfume)	0 - 5%
	Zeolite (as NaAlSiO <sub>4</sub> )  Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )  Sodium citrate/citric acid (as C <sub>6</sub> H <sub>5</sub> Na <sub>3</sub> O <sub>7</sub> /C <sub>6</sub> H <sub>6</sub> O <sub>7</sub> )  Carboxymethyl cellulose  Polymers (e.g. maleic/acrylic acid copolymer, PVP, PEG)  Enzymes (calculated as pure enzyme protein)

10 3) A detergent composition formulated as a granulate having a bulk density of at least 600 g/l comprising

	Linear alkylbenzene sulfonate (calculated as acid)	5 - 9%
	Alcohol ethoxylate (e.g. C <sub>12.15</sub> alcohol, 7 EO)	7 - 14%
	Soap as fatty acid (e.g. C <sub>16-22</sub> fatty acid)	1 - 3%
15	Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	10 - 17%
	Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )	3 - 9%
	Zeolite (as NaAlSiO₄)	23 - 33%
	Sodium sulfate (as Na <sub>2</sub> SO4)	0 - 4%
	Sodium perborate (as NaBO <sub>3</sub> .H <sub>2</sub> O)	8 - 16%
20	TAED	2 - 8%
	Phosphonate (e.g. EDTMPA)	0 - 1%
	Carboxymethyl cellulose	0 - 2%
	Polymers (e.g. maleic/acrylic acid copolymer, PVP, PEG)	0 - 3%
	Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
25	Minor ingredients (e.g. suds suppressors, perfume, optical brightener)	0 - 5%

4) A detergent composition formulated as a granulate having a bulk density of at least 600 g/l comprising

Linear alkylbenzene sulfonate (calculated as acid)	8 - 12%
Alcohol ethoxylate (e.g. C <sub>12-15</sub> alcohol, 7 EO)	10 - 25%
Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	14 - 22%
Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )	1 - 5%
Zeolite (as NaAlSiO <sub>4</sub> )	25 - 35%
Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )	0 - 10%
Carboxymethyl cellulose	0 - 2%
Polymers (e.g. maleic/acrylic acid copolymer, PVP, PEG)	1 - 3%
Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
Minor ingredients (e.g. suds suppressors, perfume)	0 - 5%
	Alcohol ethoxylate (e.g. C <sub>12-15</sub> alcohol, 7 EO)  Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )  Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )  Zeolite (as NaAlSiO <sub>4</sub> )  Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )  Carboxymethyl cellulose  Polymers (e.g. maleic/acrylic acid copolymer, PVP, PEG)  Enzymes (calculated as pure enzyme protein)

### 5) An aqueous liquid detergent composition comprising

·	Linear alkylbenzene sulfonate (calculated as acid)	15 - 21%
	Alcohol ethoxylate (e.g. C <sub>12-15</sub> alcohol, 7 EO or C <sub>12-15</sub> alcohol, 5 EO)	12 - 18%
15	Soap as fatty acid (e.g. oleic acid)	3 - 13%
ļ	Alkenylsuccinic acid (C <sub>12-14</sub> )	0 - 13%
	Aminoethanol	8 - 18%
	Citric acid	2 - 8%
	Phosphonate	0 - 3%
20	Polymers (e.g. PVP, PEG)	0 - 3%
	Borate (as B <sub>2</sub> O <sub>7</sub> )	0 - 2%
	Ethanol	0 - 3%
	Propylene glycol	8 - 14%
	Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
25	Minor ingredients (e.g. dispersants, suds suppressors, perfume, optical brightener)	0 - 5%

#### 6) An aqueous structured liquid detergent composition comprising

	Linear alkylbenzene sulfonate (calculated as acid)	15 - 21%
5	Alcohol ethoxylate (e.g. C <sub>12-15</sub> alcohol, 7 EO, or C <sub>12-15</sub> alcohol, 5 EO)	3 - 9%
	Soap as fatty acid (e.g. oleic acid)	3 - 10%
	Zeolite (as NaAlSiO <sub>a</sub> )	14 - 22%
	Potassium citrate	9 - 18%
	Borate (as B <sub>4</sub> O <sub>7</sub> )	0 - 2%
	Carboxymethyl cellulose	0 - 2%
10	Polymers (e.g. PEG, PVP)	0 - 3%
	Anchoring polymers such as, e.g., lauryl methacrylate/acrylic acid copolymer; molar ratio 25:1; MW 3800	0 - 3%
	Glycerol	0 - 5%
15	Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
	Minor ingredients (e.g. dispersants, suds suppressors, perfume, optical brighteners)	0 - 5%

## 7) A detergent composition formulated as a granulate having a bulk density of at least 600 g/l comprising

	*	
20	Fatty alcohol sulfate	5 - 10%
	Ethoxylated fatty acid monoethanolamide	3 - 9%
	Soap as fatty acid	0 - 3%
	Sodium carbonate (as Na,CO <sub>3</sub> )	5 - 10%
	Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )	1 - 4%
25	Zeolite (as NaAlSiO <sub>4</sub> )	20 - 40%
	Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )	2 - 8%
	Sodium perborate (as NaBO <sub>3</sub> .H <sub>2</sub> O)	12 - 18%
	TAED	2 - 7%
	Polymers (e.g. maleic/acrylic acid copolymer, PEG)	1 - 5%

Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
Minor ingredients (e.g. optical brightener, suds suppressors, perfume)	0 - 5%

## 8) A detergent composition formulated as a granulate comprising

Linear alkylbenzene sulfonate (calculated as acid)	8 - 14%
Ethoxylated fatty acid monoethanolamide	5 - 11%
Soap as fatty acid	0 - 3%
Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	4 - 10%
Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )	1 - 4%
Zeolite (as NaAlSiO <sub>4</sub> )	30 - 50%
Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )	3 - 11%
Sodium citrate (as C <sub>e</sub> H <sub>s</sub> Na <sub>3</sub> O <sub>7</sub> )	5 - 12%
Polymers (e.g. PVP, maleic/acrylic acid copolymer, PEG)	1 - 5%
Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
Minor ingredients (e.g. suds suppressors, perfume)	0 - 5%
	Ethoxylated fatty acid monoethanolamide  Soap as fatty acid  Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )  Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )  Zeolite (as NaAlSiO <sub>4</sub> )  Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )  Sodium citrate (as C <sub>6</sub> H <sub>2</sub> Na <sub>3</sub> O <sub>7</sub> )  Polymers (e.g. PVP, maleic/acrylic acid copolymer, PEG)  Enzymes (calculated as pure enzyme protein)

## 9) A detergent composition formulated as a granulate comprising

	Linear alkylbenzene sulfonate (calculated as acid)	6 - 12%
	Nonionic surfactant	1 - 4%
	Soap as fatty acid	2 - 6%
20	Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	14 - 22%
	Zeolite (as NaAlSiO <sub>a</sub> )	18 - 32%
	Sodium sulfate (as Na <sub>z</sub> SO <sub>4</sub> )	5 - 20%
	Sodium citrate (as C <sub>6</sub> H <sub>5</sub> Na <sub>5</sub> O <sub>7</sub> )	3 - 8%
	Sodium perborate (as NaBO <sub>3</sub> .H <sub>2</sub> O)	4 - 9%
25	Bleach activator (e.g. NOBS or TAED)	1 - 5%
	Carboxymethyl cellulose	0 - 2%
	Polymers (e.g. polycarboxylate or PEG)	1 - 5%
	· · · · · · · · · · · · · · · · · · ·	

Linear alkylbenzene sulfonate (calculated as acid)	6 - 12%
Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
Minor ingredients (e.g. optical brightener, perfume)	0 - 5%

### 10) An aqueous liquid detergent composition comprising

	Linear alkylbenzene sulfonate (calculated as acid)	15 - 23%
5	Alcohol ethoxysulfate (e.g. C <sub>12-15</sub> alcohol, 2-3 EO)	8 - 15%
	Alcohol ethoxylate (e.g. $C_{12-15}$ alcohol, 7 EO, or $C_{12-15}$ alcohol, 5 EO)	3 - 9%
	Soap as fatty acid (e.g. lauric acid)	0 - 3%
	Aminoethanol	1 - 5%
10	Sodium citrate	5 - 10%
	Hydrotrope (e.g. sodium toluene sulfonate)	2 - 6%
	Borate (as B <sub>4</sub> O <sub>7</sub> )	0 - 2%
	Carboxymethyl cellulose	0 - 1%
	Ethanol	1 - 3%
15	Propylene glycol	2 - 5%
	Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
	Minor ingredients (e.g. polymers, dispersants, perfume, optical brighteners)	0 - 5%

### 11) An aqueous liquid detergent composition comprising

20	Linear alkylbenzene sulfonate (calculated as acid)	20 - 32%
	Alcohol ethoxylate (e.g. $C_{12-13}$ alcohol, 7 EO, or $C_{12-13}$ alcohol, 5 EO)	6 - 12%
	Aminoethanol	2 - 6%
	Citric acid	8 - 14%
25	Borate (as B <sub>4</sub> O <sub>7</sub> )	1 - 3%
	Polymer (e.g. maleic/acrylic acid copolymer, anchoring polymer such as, e.g., lauryl methacrylate/acrylic acid copolymer)	0 - 3%

Linear alkylbenzene sulfonate (calculated as acid)	20 - 32%
Glycerol	3 - 8%
Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
Minor ingredients (e.g. hydrotropes, dispersants, perfume, optical brighteners)	0 - 5%

5 12) A detergent composition formulated as a granulate having a bulk density of at least 600 g/l comprising

	Anionic surfactant (linear alkylbenzene sulfonate, alkyl sulfate, alpha-olefin sulfonate, alpha-sulfo fatty acid methyl esters, alkane sulfonates, soap)	25 - 40%
10	Nonionic surfactant (e.g. alcohol ethoxylate)	1 - 10%
	Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	8 - 25%
	Soluble silicates (as Na <sub>2</sub> O, 2SiO <sub>2</sub> )	5 - 15%
	Sodium sulfate (as Na <sub>2</sub> SO <sub>4</sub> )	0 - 5%
	Zeolite (as NaAlSiO <sub>4</sub> )	15 - 28%
15	Sodium perborate (as NaBO <sub>3</sub> .4H <sub>2</sub> O)	0 - 20%
	Bleach activator (TAED or NOBS)	0 - 5%
	Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
	Minor ingredients (e.g. perfume, optical brighteners)	0 - 3%

- 13) Detergent formulations as described in 1) 12) wherein all or part of the linear 20 alkylbenzene sulfonate is replaced by  $(C_{12}-C_{10})$  alkyl sulfate.
  - 14) A detergent composition formulated as a granulate having a bulk density of at least 600 g/l comprising

	(C <sub>12</sub> -C <sub>18</sub> ) alkyl sulfate	9 - 15%
	Alcohol ethoxylate	3 - 6%
25	Polyhydroxy alkyl fatty acid amide	1 - 5%
	Zeolite (as NaAlSiO <sub>4</sub> )	10 - 20%

	(C <sub>12</sub> -C <sub>18</sub> ) alkyl sulfate	9 - 15%
	Layered disilicate (e.g. SK56 from Hoechst)	10 - 20%
	Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	3 - 12%
Ī	Soluble silicate (as Na₂O,2SiO₂)	0 - 6%
Ì	Sodium citrate	4 - 8%
5	Sodium percarbonate	13 - 22%
	TAED	3 - 8%
	Polymers (e.g. polycarboxylates and PVP=	0 - 5%
	Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
10	Minor ingredients (e.g. optical brightener, photo bleach, perfume, suds suppressors)	0 - 5%

15) A detergent composition formulated as a granulate having a bulk density of at least 600 g/l comprising

	(C <sub>12</sub> -C <sub>18</sub> ) alkyl sulfate	4 - 8%
Ī	Alcohol ethoxylate	11 - 15%
15	Soap	1 - 4%
	Zeolite MAP or zeolite A	35 - 45%
	Sodium carbonate (as Na <sub>2</sub> CO <sub>3</sub> )	2 - 8%
	Soluble silicate (as Na <sub>2</sub> O,2SiO <sub>2</sub> )	0 - 4%
	Sodium percarbonate	13 - 22%
20	TAED	1 - 8%
	Carboxymethyl cellulose	0 - 3%
	Polymers (e.g. polycarboxylates and PVP)	0 - 3%
	Enzymes (calculated as pure enzyme protein)	0.0001 - 0.1%
25	Minor ingredients (e.g. optical brightener, phosphonate, perfume)	0 - 3%

- 16) Detergent formulations as described in 1) 15) which contain a stabilized or encapsulated peracid, either as an additional component or as a substitute for already specified bleach systems.
- 17) Detergent compositions as described in 1), 3), 7), 9) and 12) wherein perborate 5 is replaced by percarbonate.
  - 18) Detergent compositions as described in 1), 3), 7), 9), 12), 14) and 15) which additionally contain a manganese catalyst. The manganese catalyst may, e.g., be one of the compounds described in "Efficient manganese catalysts for low-temperature bleaching", Nature 369, 1994, pp. 637-639.
- 10 19) Detergent composition formulated as a nonaqueous detergent liquid comprising a liquid nonionic surfactant such as, e.g., linear alkoxylated primary alcohol, a builder system (e.g. phosphate), enzyme and alkali. The detergent may also comprise anionic surfactant and/or a bleach system.

The lipolytic enzyme of the invention may be incorporated in concentrations 15 conventionally employed in detergents. It is at present contemplated that, in the detergent composition of the invention, the lipolytic enzyme may be added in an amount corresponding to 0.00001-1 mg (calculated as pure enzyme protein) of lipolytic enzyme per liter of wash liquor.

#### **EXAMPLES**

#### 20 Example 1

Production of lipolytic enzyme from Botryosphaeria sp.

The following media were used in this example:

	Medium	YS-2	YS-25
	рН	6.5	6.5
	Glucose	20 g/L	5 g/L
	Yeast extract	10 g/L	10 g/L
5	Peptone	10 g/L	10 g/L
	K,HPO.	5 g/L	5 g/L
	MgSO <sub>4</sub> -7H <sub>2</sub> O	1 g/L	1 g/L
	Soybean oil	0	2 ml/100 ml

A seed culture was prepared by inoculating strain CBS 102.95 from a slant 10 of PDA (product of Difco) to two shake flasks containing 100 ml of YS-2 medium, and incubating the shake flasks with shaking for 2 days at 27°C. The final pH was 7.5.

A main culture was prepared by using the seed culture to inoculate 50 shake flasks with 100 ml of YS-25 medium and incubating for 2 days at 27°C with shaking. 15 The final pH was 7.3.

2,900 ml of cell-free broth with a lipolytic enzyme activity of 17 LU/ml was recovered after removal of the cell mass. This was dejonized and freeze-dried to obtain 11.9 g of powder sample with a lipolytic enzyme activity of 3,540 LU/g.

#### Example 2

#### 20 Production of lipolytic enzyme from Botryosphaeria ribis

Lipolytic enzyme was produced in the same manner as in Example 1, except that strain CBS 504.94 was used, and 3 days were used for the main culture. A cell-free broth with a lipolytic enzyme activity of 10 LU/ml was recovered after removal of the cell mass. This was deionized and freeze-dried to obtain 17.8 g of powder 25 sample with a lipolytic enzyme activity of 3,050 LU/g.

#### Example 3

Purification and characterization of lipolytic enzyme from Botryosphaeria sp.

#### Purification procedure

Crude lipolytic enzyme from *Botryosphaeria sp.* CBS 102.95 was purified 5 using a 2-step protocol using anion exchange and hydrophobic chromatography, as follows.

#### Anion exchange chromatography

6.2 g of the lipolytic enzyme preparation from Example 1 was dissolved in 10 mM Tris-HCl, pH 7 and dialyzed against the same buffer. The solution was applied onto a column packed with Q Sepharose (product of Pharmacia) equilibrated with the same buffer at a flow rate of 5 ml/min. Unbound material was washed with the same buffer, and the lipolytic enzyme was eluted with a linear gradient of 0-1 M NaCl concentration in the same buffer. Obtained fractions were assayed for lipolytic enzyme activity and pooled. The yield of this step was 54%.

#### 15 Hydrophobic chromatography

To the lipolytic enzyme pool, ammonium acetate was added to give a final concentration of 0.8 M. The solution was applied to a column packed with Butyl Sepharose (product of Pharmacia) previously equilibrated with 0.8 M ammonium acetate. After thoroughly washing with a large amount of the same buffer, elution was done firstly with milli-Q-water and secondly with 30% isopropanol. The water fraction contained 59% of the applied activity, and the isopropanol fraction contained 27%.

#### Summary of the purification

Γ	Step	Activity (LU)	Yield (%)
	Powder	22,000	100
	Q Sepharose	11,850	54
5	Butyl Sepharose	·	
	water pool	6,990	32
	isopropanol pool	3,200	15

#### Characterization

Purity and molecular weight of the lipolytic enzyme were analyzed using a 4.20% gradient SDS-PAGE gel (Novex) under standard conditions. Molecular weight marker proteins were purchased from Pharmacia. After electrophoresis, proteins were stained with Coomassie brilliant blue. The molecular weight of the lipolytic enzyme from both the water pool and the isopropanol were found to be 55,000.

The pl of the lipolytic enzyme was measured using Ampholine PAG plate, pH 15 3.5-9.5 (product of Pharmacia). pl marker proteins from Pharmacia were used. The pl of the lipolytic enzyme from both pools was pl 3.8.

These results indicated that the lipolytic enzyme from the two pools obtained from Butyl Sepharose is the same. The lipolytic enzyme from the water pool was chosen for use in the characterization due to the higher purity.

The specific activity of the lipolytic enzyme was found to be about 400 LU/A<sub>280</sub> (protein content determined by absorbance at 280 nm).

#### Example 4

Purification and characterization of lipolytic enzyme from *Botryosphaeria ribis*<u>Purification procedure</u>

25 Crude lipolytic enzyme from *Botryosphaeria ribis* CBS 504.94 was purified by 3 steps as follows.

#### STREAM LINE™ column chromatography

The first step was STREAM LINE column chromatography. 14.3 g of the freeze-dried powder from Example 2 and 3.5 g of a another freeze-dried powder (made in essentially the same manner as in Example 2 and having a lipolytic enzyme 5 activity of 1780 LU/g) were dissolved in 50 mM Tris-HCl buffer (pH 7.6). The lipolytic enzyme was adsorbed on a column of DEAE resin equilibrated with the same buffer, and the column was washed with the same buffer. The lipolytic enzyme was eluted with the same buffer including 0.5 M NaCl. The yield of this step was 45%.

#### Hydrophobic column chromatography

The second step was hydrophobic column chromatography using pre-packed Butyl Toyopearl (product of Toyo Soda) and HPLC. The concentrated lipolytic enzyme was adjusted to a salt concentration of 1 M ammonium acetate. Elution was carried out by a linear gradient of 1-0 M ammonium acetate and 20% ethanol. The fractions showing lipolytic enzyme activity were gathered. Ultrafiltration was performed to concentrate and desalt. The yield of this step was 89%.

#### Anion exchange column chromatography

The third step was anion exchange column chromatography using prepacked DEAE Toyopearl (product of Toyo Soda). The lipolytic enzyme was adjusted
to pH 7.6 and 0.1 M NaCl. This was applied to the column equilibrated with 50 mM
20 Tris-HCl buffer (pH 7.6) including 0.1 M NaCl, and the lipolytic enzyme was eluted
with a linear gradient of 0.1-2 M NaCl. The chromatogram showed two peaks with
lipolytic enzyme activity. The fractions corresponding to the first peak were gathered
and dialyzed for use in characterization of the lipolytic enzyme.

#### Summary of purification

Step	Activity (LU)	Yield	i (%)
Powder	64615		100
STREAM LINE	29070	44.9	44.9
Butyl Toyopearl	26814	92.2	41.4
DEAE Toyopearl	4984	18.6	7.7

#### Molecular weight

The molecular weight of the purified lipolytic enzyme was calculated by SDS-PAGE and gel filtration column chromatography. SDS-PAGE was carried out using a 10-15 gradient gel (product of Pharmacia) and Phast System<sup>™</sup> under standard conditions. Molecular weight marker proteins were purchased from Pharmacia. After hydrolysis, proteins were stained with Coomassie brilliant blue. The molecular weight of the lipolytic enzyme was found to be 64,000.

Gel filtration chromatography was carried out with Superdex 200pg 26/60 15 (product of Pharmacia) and HPLC. 2 ml of purified lipolytic enzyme was applied onto the column equilibrated with 50 mM Tris-HCl buffer including 0-1 M NaCl, and lipolytic enzyme was eluted with the same buffer. The flow rate was 3 ml/min. Gel Filtration Calibration Kit (product of Pharmacia) was used as the standard proteins. The molecular weight was found to be 54,000.

#### 20 <u>Iso-electric point</u>

The pl of the lipolytic enzyme was determined by IEF-PAGE using a 3-9 gradient gel and Phast System<sup>™</sup>. pl marker proteins from Pharmacia were used. After electrophoresis, there was one band below pH 3.5 with the Coomassie brilliant blue staining. The lipolytic enzyme activity was found at the same position using olive oil emulsion and brilliant green.

#### Specific activity

The specific activity was found to be about 300 LU/mg. The protein amount was measured by protein assay kit, and Bovine Plasma Globulin Lyophilized was used as standard (product of Bio-Rad).

#### 5 Example 5

#### Production of lipolytic enzyme from various strains

Each of the strains listed below was cultivated on an agar slant. About 1 cm<sup>2</sup> of the slant culture was scraped off and used to inoculate 100 ml of YS-2 medium in 500 ml shake flasks with two baffles. This seed culture was incubated at 30°C with 10 shaking (approx. 220 rpm) for 2 days.

A main culture was prepared by inoculating 3 ml of the seed culture into 100 ml of YS-25 in 500 ml shake flasks with two baffles and cultivating at 30°C with shaking (approx. 220 rpm). The cultivation was continued for 3 days, except that it was extended to 6 days for the strains NN102563 and NN102564 because they were 15 observed to grow more slowly than the other strains. At the end of cultivation, the lipolytic enzyme activity of the broth was measured.

Each experiment was carried out twice, and the results (average of the two experiments) were as follows:

	Species	Strain No.	Lipolytic enzyme activity (LU/ml)
20	B. dothidea	NN102558	1.5
	B. dothidea	NN102559	1.6
	B. dothidea	NN102560	1.4
	B. dothidea	NN102561	1.4
	B. dothidea	NN102562	14.5
25 .	G. laricina	NN102563	0.2

G. laricina	NN102564	1.4
B. berengeriana	NN102565	1.1
B. berengeriana f. sp. pilicola	NN102566	1.3
G. paulowniae	NN102567	5.3
Botryosphaeria sp.	NN143554	27.0
B. ribis	NN115210	4.8
B. parva	NN103321	4.8
B. ribis	NN103322	1.7
B. ribis var. chromogena	NN103313	4.2
B. xanthocephala	NN103324	3.3
	B. berengeriana  B. berengeriana f. sp. pilicola  G. paulowniae  Botryosphaeria sp.  B. ribis  B. parva  B. ribis  B. ribis  B. ribis	B. berengeriana NN102565  B. berengeriana f. sp. NN102566  pilicola NN102567  Botryosphaeria sp. NN143554  B. ribis NN115210  B. parva NN103321  B. ribis NN103322  B. ribis var. chromogena NN103313

It is seen that lipolytic enzyme could be obtained from all the strains tested. It is further seen that the yield with the strain *Botryosphaeria* NN143554 (CBS 102.95) which was isolated by the inventors is remarkably higher than with\_other strains.

#### 15 Example 6

#### Plate test for lipolytic enzyme activity at pH 10

The plate test described in Example 11 of WO 88/02775 (corresponding to JP-W 1-501120) was used to check for lipolytic enzyme activity at pH 10 with and without the addition of Ca<sup>\*\*</sup>, using culture broth from the previous example. The samples from all strains tested in Example 5 were found to exhibit lipolytic enzyme activity at pH 10, both with and without Ca<sup>\*\*</sup> addition.

#### Example 7

#### Determination of partial amino acid sequences

Purified lipases from *B. ribis* NN115210 and *Botryosphaeria sp.* NN143554 were subjected to sequencing.

No N-terminal amino acid sequences were obtained by direct sequencing of the two lipases. This shows that the N-terminal amino-group is blocked.

The two lipases were reduced and S-carboxymethylated before degradation with a lysyl-specific protease. The resulting peptides were fractionated and repurified using reversed phase HPLC before subjected to N-terminal amino acid sequencing.

5 peptide sequences were obtained from the NN115210 lipase. They are shown in the sequence listings as SEQ ID NO: 1 to 5.

The Xaa residue in SEQ ID NO: 4 is probably a glycosylated Asn residue.

One peptide sequence was obtained from the NN143554 lipase. This amino acid sequence was identical to the amino acid sequence shown in SEQ ID NO: 1 from the NN115210 lipase.

The peptide sequences were aligned to the known sequence of the lipase LIP 1 from Candida cylindracea CBS 6330 which has 534 amino acids. The five peptides were found to align to the following positions of LIP 1. The number of matching amino acids and the total amino acids in the peptide are given in parentheses. A 20 gap was inserted between positions 373-374 of the LIP 1 sequence to improve the alignment.

SEQ ID NO: 1: positions 35-47 (12/13)

SEQ ID NO: 2: positions 148-187 (22/40)

SEQ ID NO: 3: positions 255-276 (7/22)

25 SEQ ID NO: 4: positions 296-331 (11/36)

SEQ ID NO: 5: positions 365-403 (18/40, gap inserted)

Based on this alignment, it is believed that the 5 peptides are partial sequences occurring in this order.

## 31 INDICATIONS RELATING TO A DEPOSITED MICROORGANISM

(PCT Rule 13bis)

A. The indications made below relate to the microorganism referred to in the description on page 3 . lines 14 - 24		
B. IDENTIFICATION OF DEPOSIT	Further deposits are identified on an additional sheet	
Name of depositary institution		
Centraal Bureau voor Schimmelcu	ltures	
Address of depositary institution (including postal code and country)	-	
Oosterstraat 1, 3740 AG Baarn, 1	Netherlands	
Date of deposit  January 6, 1995	Accession Number CBS 102.95	
C. ADDITIONAL INDICATIONS (leave blank if not applicable	(c) This information is continued on an additional sheet	
In respect of those designation Australian patent is sought, du patent application a sample of only to be provided to an indep person requesting the sample (R of Australia Statutory Rules 19	ring the pendency of the the deposited microorganism is endent expert nominated by the ule 28(4) EPC/Regulation 3.25	
D. DESIGNATED STATES FOR WHICH INDICATION	ONS ARE MADE (if the indications are not for all designated States)	
E. SEPARATE FURNISHING OF INDICATIONS (leav	e blank if not applicable)	
The indications listed below will be submitted to the International Number of Deposit 7	Bureau later (specify the general nature of the indications e.g., "Accession	
For receiving Office use only	For International Bureau use only	
This sheet was received with the international application	This sheet was received by the International Bureau on:

#### **CLAIMS**

- 1. An alkaline lipolytic enzyme which
- a) is immunologically reactive with an antibody raised against a purified lipolytic enzyme produced by a strain of *Botryosphaeria* or *Guignardia*, and
- 5 b) has optimum activity at a pH in the range 9-11 in the presence of 50 mM Ca\*\*.
  - 2. The lipolytic enzyme of claim 1 wherein the strain belongs to *Botryosphaeria*, preferably *B. berengeriana*, *B. berengeriana f. sp. pilicola*, *B. dothidea*, *B. parva B. ribis*, *B. ribis* var. chromogena or *B. xanthocephala*.
- The lipolytic enzyme of claim 2 wherein the strain is *B. berengeriana* MAFF 06-45001, *B. berengeriana f. sp. pilicola* MAFF 06-45002, *B. dothidea* JCM 2733, JCM 2735, JCM 2736, JCM 2737, JCM 2738, *B. parva* ATCC 58191, *B. ribis* CBS 504.94, ATCC 56125, *B. ribis var. chromogena* CBS 121.26, *B. xanthocephala* ATCC 60638 or *Botryosphaeria sp.* CBS 102.95.
- 15 4. The lipolytic enzyme of claim 1 wherein the strain belongs to *Guignardia*, preferably *G. laricina* or *G. paulowniae*.
  - 5. The lipolytic enzyme of claim.4 wherein the strain is *G. laricina* IFO 7887, IFO 7888 or *G. paulowniae* MAFF 03-05151.
- 6. An alkaline lipolytic enzyme which contains an amino acid sequence selected 20 from the group consisting of SEQ ID NO: 1, 2, 3, 4 and 5.
  - 7. The lipolytic enzyme of claim 6 wherein the sequence contains all of said sequences, preferably in the stated order.

- 8. The lipolytic enzyme of any of claims 1-7 provided as a detergent additive in the form of a non-dusting granulate, a stabilized liquid, a slurry, or a protected enzyme.
- 9. A biologically pure culture of *Botryosphaeria sp.* CBS 102.95 or a lipolytic s enzyme-producing mutant thereof.
  - 10. A method for producing a lipolytic enzyme, comprising cultivation of a lipolytic enzyme-producing strain of *Botryosphaeria* or *Guignardia* in a suitable nutrient medium, followed by recovery of the alkaline lipolytic enzyme.
- 11. The method of claim 10, wherein the lipolytic enzyme is an alkaline lipolytic10 enzyme having optimum activity at a pH in the range 9-11 in the presence of 50 mM Ca\*\*.
- The method of claim 10 or 11, wherein the strain is B. berengeriana MAFF 06-45001, B. berengeriana f. sp. pilicola MAFF 06-45002, B. dothidea JCM 2733, JCM 2735, JCM 2736, JCM 2737, JCM 2738, B. parva ATCC 58191, B. ribis CBS 504.94,
   ATCC 56125, B. ribis var. chromogena CBS 121.26, B. xanthocephala ATCC 60638, Botryosphaeria sp. CBS 102.95, G. laricina IFO 7887, IFO 7888 or G. paulowniae MAFF 03-05151.
  - 13. A method for producing a lipolytic enzyme, comprising:
- a) isolating a DNA sequence encoding the lipolytic enzyme from a lipolytic 20 enzyme-producing strain of *Botryosphaeria* or *Guignardia*,
  - b) combining the DNA fragment with appropriate expression signal(s) in an appropriate vector,
    - c) transforming a suitable heterologous host organism with the vector.
- d) cultivating the transformed host organism under conditions leading to 25 expression of the lipolytic enzyme, and
  - e) recovering the lipolytic enzyme from the culture medium.

- 14. The method of claim 13, wherein the lipolytic enzyme is an alkaline lipolytic enzyme having optimum activity at a pH in the range 9-11 in the presence of 50 mM Ca\*\*.
- 15. The method of claim 13 or 14, wherein the lipolytic enzyme-producing strain is *B. berengeriana* MAFF 06-45001, *B. berengeriana f. sp. pilicola* MAFF 06-45002, *B. dothidea* JCM 2733, JCM 2735, JCM 2736, JCM 2737, JCM 2738, *B. parva* ATCC 58191, *B. ribis* CBS 504.94, ATCC 56125, *B. ribis* var. chromogena CBS 121.26, *B. xanthocephala* ATCC 60638, *Botryosphaeria sp.* CBS 102.95, *G. laricina* IFO 7887, IFO 7888 or *G. paulowniae* MAFF 03-05151.
- 10 16. The method of any of claims 13-15, wherein the host organism is a filamentous fungus, preferably a strain of the genus *Aspergillus*.
  - 17. The method of any of claims 13-15, wherein the DNA sequence is isolated by a method comprising:
- a) cloning, in suitable vectors, a cDNA library from the lipolytic enzyme-15 producing strain of *Botryosphaeria* or *Guignardia*,
  - b) transforming suitable yeast host cells with said vectors,
  - c) cultivating the transformed yeast host cells under suitable conditions to express the alkaline lipolytic enzyme,
- d) screening for positive clones by determining the lipolytic enzyme activity 20 expressed in step (c).
  - 18. A detergent composition comprising a surfactant and an alkaline lipolytic enzyme which
  - a) is immunologically reactive with an antibody raised against a purified lipolytic enzyme produced by a strain of *Botryosphaeria* or *Guignardia*, and
- b) has optimum activity at a pH in the range 9-11 in the presence of 50 mM Ca\*\*.

19. A detergent composition comprising a surfactant and an alkaline lipolytic enzyme which contains an amino acid sequence selected from the group consisting of SEQ ID NO: 1, 2, 3, 4 and 5.
